

Intoduction to Modular Arithmetic, mod 10

Exercises

September 7, 2016

1 Introduction

Modular arithmetic is a very useful way of working with numbers. It is based on looking at the remainder of a number when divided by another number. Here are some examples:

1. 25 divided by 10 has a remainder of 5, we write as

$$25 \equiv 5(\text{mod } 10)$$

2. 20 divided by 10 has a remainder of 0 we can write as:

$$20 \equiv 0(\text{mod } 10)$$

3. 36 divided by 10 has a remainder of 6, we can write as:

$$36 \equiv 6(\text{mod } 10)$$

2 Exercises

Fill in the blanks for each of the following:

1. $23 \equiv \underline{\hspace{1cm}}(\text{mod } 10)$
2. $57 \equiv \underline{\hspace{1cm}}(\text{mod } 10)$
3. $124 \equiv \underline{\hspace{1cm}}(\text{mod } 10)$
4. $31 + 15 \equiv \underline{\hspace{1cm}}(\text{mod } 10)$
5. $\underline{\hspace{1cm}} \equiv 7(\text{mod } 10)$
6. $\underline{\hspace{1cm}} \equiv 3(\text{mod } 10)$
7. $9 + 8 \equiv \underline{\hspace{1cm}}(\text{mod } 10)$
8. $9 + 1 \equiv \underline{\hspace{1cm}}(\text{mod } 10)$
9. $6 + \underline{\hspace{1cm}} \equiv 0(\text{mod } 10)$
10. $3 + \underline{\hspace{1cm}} \equiv 0(\text{mod } 10)$
